

Project Summary — Financial Data Analysis Using Excel Pivot Tables

Objective

To analyze the financial performance of a company over a four-year period (2015–2018) using Excel pivot tables.

The project focuses on calculating sales revenue, total cost, and gross profit, as well as identifying profitability trends across different regions, brands, and collections.

Data Cleaning

- Verified and corrected inconsistent year entries in the dataset (e.g., 2117 → 2017).
- Checked for missing or duplicate values in key columns such as *date_of_sale*, *sales revenue*, and *cost*.
- Formatted numeric fields as accounting values with two decimal places.
- Ensured data consistency for region and brand names before building pivot tables.

Pivot Table Analysis

- Created pivot tables to summarize **sales revenue**, **total cost**, and **gross profit** by year, region, brand, and collection.
- Added a **calculated field** for $Gross Profit \% = Gross Profit / Sales Revenue$.
- Built pivot charts to visualize sales and profit trends over the four-year period.
- Filtered and sorted results to identify the most profitable brands, collections, and regions in 2018.

Key Finding

- Sales revenue and gross profit increased steadily from 2015 to 2018.
- The Midwest region demonstrated the fastest growth in sales revenue.
- *Jeffrey Alexander* was the most profitable brand in 2018, with a gross profit percentage of 39.88%.
- The weighted average gross profit percentage for *Jeffrey Alexander* and *Elements* combined in 2018 was **38.95%**.

Tools Used

- **Microsoft Excel:** Pivot Tables, Calculated Fields, Pivot Charts
- **Techniques:** Financial Data Cleaning, Profitability Analysis, Weighted Average Calculation
- **Skills Demonstrated:** Accounting Analysis · Business Analytics · Excel Data Visualization
